Assignment: State & Architecture

Mobile Applications Development 2

Instructions

Finish the Favorites application by completing the missing features from Module 3. You will practice shared state, reusable components, category-based content, local storage, settings, and synchronized updates across multiple screens.

Use concepts learned in Module 3.

App Theme

Continue working on the Favorites application from this module. The app should allow users to browse different content categories, mark items as favorites, view favorited items, manage saved preferences, and clear saved favorite selections.

Requirements

(Flutter Only) Make sure the Hobbies category works correctly. The Hobbies section should display the hobby data, show each hobby with its name and visual icon, and allow users to favorite and unfavorite hobbies.

Add support for the Books category. Use the existing hardcoded book data provided in the project. Display books alongside the other categories and show each book with its title and author. Allow users to favorite and unfavorite books just like the other categories.

Update the Favorites screen so it displays all favorited items from every category included in the app.

Allow users to remove items directly from the Favorites screen by unfavoriting them. The

Favorites screen should update immediately when an item is removed.

(Flutter Only) Make the search feature work. The search bar should filter the currently selected category based on the user's typed text.

Complete the Settings screen. Save the selected theme mode using local storage so the user's theme preference remains available after the application is closed and reopened.

(Flutter Only) Add a Clear Favorites button. When the user taps the button, show a confirmation message before removing all saved favorites.

Make sure favorite selections stay synchronized across the app. If a user changes an item in one place, the change should be reflected anywhere else that item appears.

Make sure your UI remains consistent with the existing app design.

Design Expectations

Your app should look like a finished mobile application, not a quick test screen. Pay attention to spacing, alignment, colors, fonts, icons, images, and overall visual balance.

Use a consistent design style across all categories and screens. Cities, hobbies, books, favorites, and settings may use different layouts, but they should still feel like they belong to the same app.

You are encouraged to polish cards, rows, buttons, settings controls, empty states, and confirmation messages so the app feels complete.

Track Instructions

Native iOS Track: Complete this assignment in SwiftUI using Xcode.

Flutter Track: Complete this assignment in Flutter using VS Code.

Deliverables

Create a GitHub repository for your project and submit a GitHub link for it. Your submission must include:

- A working Favorites application
- Multiple content categories
- Favorite and unfavorite functionality

- A Favorites screen that displays favorited items
- The ability to remove items from the Favorites screen
- Local data persistence for saved choices
- A completed Settings screen
- A clear favorites option where required by your track
- A consistent and polished visual design

Assignment3

Criteria	Ratings		Pts
Interface Layout and Design Application includes a clean layout, proper spacing, readable text, images or visual elements, and an overall polished design that matches the app theme.	**20 pts Full Marks**	**0 pts No Marks**	20 pts
Books and Hobbies Categories Application correctly implements the Books and Hobbies categories, displays the required content, and allows users to favorite and unfavorite items.	**20 pts Full Marks**	**0 pts No Marks**	20 pts
Favorites Functionality Favorites screen correctly displays favorited items from all categories. Users can add and remove favorites, and changes remain synchronized throughout the application.	**30 pts Full Marks**	**0 pts No Marks**	30 pts
Local Storage and Settings Application correctly saves user preferences and favorite selections between launches and includes the required settings functionality.	**15 pts Full Marks**	**0 pts No Marks**	15 pts
Code Organization and Reusability Code is organized, readable, and separated into reusable components, widgets, views, models, or similar structures where appropriate.	**15 pts Full Marks**	**0 pts No Marks**	15 pts
			Total Points: 100
